SOME OTHER KIND OF LOVE

Ankit

Null

Null doesn't mean anything. It's not zero or something we could measure. In computer science it's often used as a terminator, visually it doesn't have any representation. I have seen a lot of persons and their emotions define them but some are very difficult to understand. They are void of these emotions. Null emotions.

I study artificial intelligence and neuroscience and emotions have been an integral part of my life. It's what defines us, humans. Science love proofs involving experimental results or mathematical equations. Emotions don't have any explanation except the biological one which involves a bunch of hormones, neurons and the circuitry of the brain.

Yet.

We often search frantically for our answer which is most of time hidden in front of us. In this book (I hope it becomes a book) I will try to explore some of the most fundamental beliefs about emotions and connect the dots through science and mathematics.

INTUITION OF ARTIFICIAL REWARD CIRCUITS

Subroutine 1:

Zero and One

Zero has meaning but we are afraid of zero a lot because zero in real life has the notion of failure. The embarrassment we get from the society, the hopes and dreams scattered, the remarks and criticism. The negative, influencing our emotions. We get depressed and are remorseful. In this modern age of internet and social media, failure of a person is celebrated and joked. Rumor starts to spread like fire till it's doused usually by scandals, suicides and self-harm. What can an innocent person do to revert the mistake? The failure that lives on? Zero.

One. You're the one. The best of the rest. Emotions play a lot deal here again. You're the fire still burning in the cold. People have rested but you had worked to be where you are. Success. The most desired skill in today's world, *rarity*.

The culture of social media celebrates you and both fake and real people wish you all success. Isn't this what you always wanted?

One.

One and Zero are binary. This is what computers understand. Machine code. The endless strings of ones and zeros crunched by billions of computers every day. Is it important for the computers?

Do they beam with pride when they get a success?

Ones.

Or emit electronic cries for failure.

Zeros.

No they don’t. Binary doesn’t carry emotions. Humans and to some extend some animals don’t work in binary. There are various degrees of euphoria and unlimited forms of tears and grief. We get happy, get amused, cry due to happiness too. It’s very fuzzy how emotions work.

Is it possible to spark minimal bits of reward and punishment to computers? To reward them when they succeed and punish in failure?

We need to think about binary emotions.

Or not?

Subroutine 2:

Sins

Salience. What is salience?

It's rarity in my terms. It's is the quality by which it stands out relative to its neighbors. It's attention. Attention to adapt, survive and learn. Focus. We humans in general have a short span of focus on our works. We get easily distracted unlike computers who have infinite patience and keep doing the same work again and again as long we command the computer to. Is it possible that artificial intelligent agents might not have this infinite patience that we see now in dumb machines? If they do, we won't have control over them and they might object our command.

Figure 1:
The Seven Deadly Sins and the Four Last Things by ***Hieronymus Bosch***

"The Seven Deadly Sins and the Four Last Things", an oil painting by **Hieronymus Bosch**, a painter of Dutch origins whose work was known for illustrations of religious Christian concepts, vivid, detailed and fantastic imagery and landscapes, says about the seven sins of humans depicted in series of circular images, in the main big circle.

The flow goes from the bottom, wrath and then proceeding clockwise, envy, greed, gluttony, sloth, lust and pride.

[include paragraph detailing each sin after research relatable to human psychology]

Figure 2: Susan Dorothea White's, "The Seven Deadly Sins of Modern Times"

In recent time where there's always heated debates between rules drenched by stereotypes and scientific discovery supported by experimental truth and math, it would be wise to look into the 21st century work of **Susan Dorothea White's,** *"The Seven Deadly Sins of Modern Times"*, a 1993 acrylic painting which inspired heavily from **Hieronymus Bosch's,** *"The Seven Deadly Sins and the Four Last Things"*.

In her work, Susan says about the sins that can be seen inside a modern age human. Self-effacement, celibacy, workaholism, dieting, indifference, squandering and sycophancy (which she calls as “sucking up”).

[include paragraph about these sins with examples from world economy]

After all this we might think what would be the circle of sins for artificially intelligent computers?

Let’s look further into this.

Subroutine 3:

Artificial Sins

Obedience.

Subroutine 3:

Minimal Saliency

My grandma made pudding.

I ate pudding.

It was delicious.

Now I'll sleep.

I switched on the AC.

It's cool now.

I'll now snug inside a blanket be warm and sleep.

Good things in life.

Happy life is good life.

I bought Good Day Cashew Cookies. I ate them.

They were yum.

Good things in life.

I am thinking would an AI be able to be content?

Would it think about these?

Our emotions aren't just love at sight, fear of failure or pain of loss. Our emotions are built from strands of memory, of relations, of being a good egg.

It's very complex, emotions are like equations with infinite variables that change dynamically, maybe well defined in space, the domain of all human thought.

$$x_1^n + x_2^n + \ldots + x_m^n$$

Figure 3: Solving this would isolate the human emotions, probably.
